APPENDIX A 2018 LABORATORY ANALYTICAL REPORTS

1 INTRODUCTION

On behalf of EMERSUB 16 LLC, WSP USA Inc. (WSP) has prepared this Annual Offsite Groundwater Monitoring Report for activities performed in 2018 with respect to the groundwater plume emanating from the Former Kop-Flex Facility Site (Site) located at 7555 Harmans Road in Hanover, Maryland (Figure 1). The former Kop-Flex facility is identified as Site MD0286 under the Brownfield Master Inventory system used by the Maryland Department of the Environment (MDE) Land Restoration Program. This report pertains to the response action activities that were conducted to address the groundwater impacts in the offsite areas of the Site. Per the request of Richelle Hanson of MDE, this report will also include sampling undertaken at non-residential facilities bordering the former Kop-Flex facility to the north (Verizon Communications), and south and east (Williams Scotsman, Inc.) along with residential communities to the south of Maryland Route 100.

Previous environmental investigations initiated in 1996 identified soil and groundwater impacts associated with historical releases of chlorinated solvents at the former Kop-Flex facility property. In addition, the results of investigations conducted in offsite areas beginning in 2012 also showed that site-related VOCs had migrated in the deep groundwater aquifer to the south and southeast of the former facility. Since that time, an offsite groundwater monitoring plan was developed in conjunction with the onsite response actions. The objectives of the ongoing monitoring program are to evaluate the trends in concentrations of site-related VOCs in the aquifer system downgradient of the former Kop-Flex facility and whether additional actions are warranted to protect the drinking water source in the area.

This 2018 Offsite Groundwater Monitoring Report consists of the following sections:

- Section 2 – Site Background
- Section 3 – Site Conceptual Model and Hydrogeology
- Section 4 – Monitoring Well Installation Activities
- Section 5 – Sampling Procedures
- Section 6 – 2018 Quarterly Sampling Results
- Section 7 – Summary and Conclusions, including 2019 monitoring activities

2 SITE BACKGROUND

2.1 SITE DESCRIPTION

The former Kop-Flex facility is located at 7555 Harmans Road in Hanover, Anne Arundel County, Maryland. The site occupies a total area of approximately 25 acres and contains three buildings - two manufacturing/office buildings and a small groundwater treatment facility in the west-central portion of the property - which were constructed during re-development in 2016 (Figure 1). The property is bordered to the north by the Verizon maintenance facility; to the east and south by the Williams Scotsman facility, and to the west by undeveloped land along Stony Run, a tributary of the Patapsco River, new townhome development, and Harmans Road.

The former facility was constructed on previously undeveloped land in 1969 by Koppers Company, Inc., a predecessor in real estate interest of Kop-Flex, Inc. Emerson acquired Kop-Flex in 1996. Kop-Flex manufactured flexible couplings for the mechanical power transmission industry at the site. Manufacturing operations at the facility ceased in late 2012, and all equipment and machining lines have been decommissioned and removed from the Site. In December 2014, Emerson transferred the property to EMERSUB 16 LLC in preparation of selling the property to a third party, Harmans Road Associates, LLC, a corporate entity established by Trammell Crow, for future redevelopment.

Land use in nearby areas of the site is primarily characterized by residential developments (single-family homes and townhouses) and undeveloped land. A small number of areas, primarily to the north and east, have been designated for commercial and light industrial/industrial park use. A table summarizing the nearby properties is provided below.

Direction	Operator Name	Address	Property Use
North	Verizon	7545 Harmans Road	Maintenance Facility
South	William Scotsman, beyond which is Maryland State Route 100	7539 Harmans Road	Mobile Trailer Distributor – Office Area and Trailer Storage
East	William Scotsman, beyond which are railroad tracks	7539 Harmans Road	Mobile Trailer Distributor – Trailer Storage
West	Stony Run and surrounding undeveloped land and Residential Neighborhood	-----	Single family homes and town homes

3 SITE GEOLOGY AND HYDROGEOLOGY

3.1 ENVIRONMENTAL SETTING

Anne Arundel County is located within the Atlantic Coastal Plain Physiographic Province. The Hanover area is situated approximately five miles from the Fall Line, which marks the boundary at the ground surface between the unconsolidated deposits of the Coastal Plain and the igneous and metamorphic crystalline rocks of the Piedmont Physiographic Province. Based on the United States Geological Survey (USGS) topographic 7.5-minute series quadrangle map for Relay, Maryland (revised 1974), the site lies within an area of rolling to hilly terrain dissected by numerous perennial to intermittent streams. Overall, the highest elevations (greater than 200 feet above mean sea level [MSL]) occur in the Severn area south and west of the former Kop-Flex facility with the lowest area (approximately 90 feet above MSL) present to the north along Stony Run.

According to the USGS topographic map, the closest stream is Stony Run, which flows across the northwestern portion of the property. Streamflow associated with the Stony Run drainage system progresses northward and eventually discharges into the Patapsco River. Additionally, numerous small, predominately man-made pond areas have been identified and mapped in the vicinity of Stony Run and its tributaries in the Hanover-Severn area. The largest of these is a hydrologically isolated pond located approximately 0.3 mile south of the site in the Harmans Woods community.

3.2 LOCAL GEOLOGY

Evaluation of the borehole lithologic data, considering the regional stratigraphic framework, indicates the predominant unconsolidated deposits in the Hanover-Severn area include units of the Lower Cretaceous Potomac Group. The most detailed lithologic information is provided by the logging of cores obtained from boreholes drilled for the offsite monitoring wells installed in 2014 and 2018 (Figure 2). Based on this data, the following discussion provides an overview of the geologic conditions in the onsite and offsite areas.

The upper-most inter-bedded sand and clay sediment at the former facility property and adjacent parcels are a combination of Quaternary alluvial sediments associated with the depositional processes along the Stony Run drainage system and fill materials associated with historical site activities. The Quaternary alluvium consists of a complexly inter-bedded and inter-fingered sequence of coarse-grained (sands with gravel) and fine-grained (silt and clay) deposits. Occasional sand zones may exist as either isolated bodies within the finer grained sediments, or inter-fingered to interbedded layers that reflect the gradational transition between the overlying and underlying sediments. Based on the boring logs, the maximum thickness of these surficial deposits is less than 20 feet (Figure 2).

Lower Cretaceous litho-stratigraphic units underlie the surficial deposits down to an elevation of greater than -200 feet mean sea level (MSL). The primary Cretaceous-age units of interest beneath the former Kop-Flex facility and offsite area to the south include the following:

- Patapsco Formation (Upper and Lower Patapsco Aquifers)
- Arundel Clay
- Patuxent Formation (Patuxent Aquifer)

Specific information on these aquifers, shown in Figure 2, and the Arundel Clay is provided below.

3.3 LOCAL HYDROGEOLOGY

3.3.1 UPPER PATAPSCO AQUIFER

The Upper Patapsco aquifer is the shallowest hydrogeologic unit in the area of interest. Based on the hydrogeologic cross-section, the outcrop area for this aquifer extends from the vicinity of Reece Road and Old Camp Meade Road south and east beyond Telegraph Road (Maryland Route 170). The aquifer is comprised of mostly fine-medium sands, which are interbedded with clay deposits and is underlain by clayey deposits that serve as the confining unit for the Lower Patapsco aquifer.

Given the shallow nature of this aquifer, groundwater is presumed to occur under an unconfined condition within the Severn area. However, the aquifer thickness is uncertain due to the absence of shallow monitoring wells in the residential areas south of Reece Road. Based on water level data from observation wells located a short distance along strike to the northeast, the thickness of the unconfined Upper Patapsco aquifer in the Andorick Acres neighborhood would be on the order of approximately 50 feet.

3.3.2 LOWER PATAPSCO AQUIFER

The Lower Patapsco aquifer extends over the entire area of interest and ranges in thickness from approximately 150 feet at the southern boundary of the Kop-Flex property to approximately 300 feet in the Andorick Acres development south of Reece Road. Based on the borehole lithologic data, an extensive clayey layer separates the lower sand-rich zone from the overlying sand and inter-layered sand and clay deposits south of Maryland Route 100. The fine-grained low permeability sediments of the Patapsco formation serve as the confining unit much of this aquifer in the offsite area.

As part of the quarterly sampling program for the offsite monitoring wells, water level measurements are obtained during each groundwater monitoring event. Evaluation of the water level data from offsite wells MW-25 and MW-28 indicates an unconfined groundwater condition in the upper-most sand zone and semi-confined conditions within the deeper sandy deposits. The thickness of this deep sand zone varies from approximately 90 feet at the Kop-Flex property to 130 feet further downgradient in the Andorick Acres neighborhood. Evaluation of the hydraulic head data indicates a generally south-southeast flow path for groundwater in the confined portion of this aquifer.

3.3.3 ARUNDEL CLAY

The Arundel clay underlies the Lower Patapsco aquifer. This unit consists predominately of clay that ranges in color from gray to dark gray and red to very dark brown, with rare beds of well-graded sand. Organic (plant) matter is present throughout much of the clayey deposits comprising this litho-stratigraphic unit in the offsite area. Based on the lithologic logs for offsite wells that were advanced through the Arundel Clay and into the underlying Patuxent Aquifer (MW-30D-413, and MW-36D), the approximate thickness for this unit ranges from 90 feet to 125 feet over the Hanover-Severn area.

3.3.4 PATUXENT AQUIFER

The Patuxent aquifer is the deepest aquifer encountered in the Severn area, and comprises the porous sand deposits of the Patuxent Formation underlying the Arundel Clay. Detailed information on the texture and thickness of this hydrogeologic unit is minimal in the area of interest due to the limited advancement of well boreholes into this aquifer. Based on regional studies, the Patuxent aquifer is believed to approach a thickness of approximately 250 feet in western Anne Arundel County.

Prior to the 2018 well installation activities, no monitoring wells had been completed in the Patuxent aquifer as part of the offsite groundwater investigation activities. The deeper well at the MW-30D location, as well as MW-36D, were installed beneath the Arundel Clay to provide more hydrogeologic and geochemical information from this aquifer.

4 2018 MONITORING WELL INSTALLATION ACTIVITIES

4.1 DRILLING AND WELL INSTALLATION

Six offsite monitoring wells - MW-29D, MW-30D well pair, MW-32D, MW-34D, and MW-36D - were installed in March and April 2018 within Public right of ways (ROW's) using the roto-sonic drilling method. The wells were completed in the Lower Patapsco aquifer at five different locations to further monitor VOC concentrations in groundwater hydraulically downgradient of the Kop-Flex property. At the MW-30 location, a second well screened in the deeper Patuxent aquifer was paired with the Lower Patapsco aquifer well. MW-46D was installed on the adjacent Verizon property after the monitoring wells in the public ROW's were completed. The purpose of this monitoring well is to evaluate site-related VOCs in the northeast portion of the VOC plume. These new monitoring well locations are shown on Figure 3.

During borehole advancement, continuous, 10-20-foot-long cores of the unconsolidated aquifer materials were obtained using a 4-inch-diameter core barrel. The recovered material from each core run was logged using the Unified Soil Classification System by a WSP Geologist, and the descriptive information recorded in a bound field notebook. Lithologic descriptions of the aquifer material contained in the core samples and discrete interval groundwater sampling results were used to determine the actual borehole termination depth. The depth for each well borehole is provided in Table 1.

For wells completed in the upper portion of the Patuxent aquifer, advancement of the boring was halted upon identification of the dark-colored, carbonaceous clayey sediments indicative of the Arundel Clay confining unit. The borehole was then over-drilled to an approximate depth of 2 feet below the top of the confining clay unit, and a 7-inch diameter temporary steel casing seated into the clayey unit to seal off the overlying Lower Patapsco sand deposits. Drilling continued through the temporary casing to the termination depth.

Following the drilling and groundwater depth-discrete profiling activities (described in Section 4.2), each borehole was completed as a single groundwater monitoring well. The well depth and screen interval were determined in the field based on the depth-discrete groundwater profiling (both field screening and laboratory results) and available hydrogeologic data for the aquifer. Since all well borings (except MW-30D-273) were terminated at a greater depth than the actual well completion depth, the borehole was backfilled with bentonite chips to allow for construction of the well at the desired depth. Construction information for all offsite monitoring wells is provided in Table 1.

4.2 GROUNDWATER PROFILING

Depth-discrete groundwater sampling, or groundwater profiling, was performed during installation of the deepest well borehole at each of the new monitoring well locations. The following discussion provides a summary of the profiling activities and analytical data for the samples collected during borehole advancement. Additional information regarding the groundwater profiling procedures and results, including laboratory analytical reports for the samples, can be found in Quarterly Status Reports No. 6[1] and 7[2] for the offsite area.

[1] WSP USA (2018) Quarterly Status Report No. 6 – Offsite Area. Former Kop-Flex Facility, Hanover, Maryland
[2] WSP USA (2018) Quarterly Status Report No. 7 – Offsite Area. Former Kop-Flex Facility, Hanover, Maryland

During borehole advancement, depth-discrete groundwater samples were collected at approximately 10-foot intervals in the following hydro-stratigraphic units:

- Lower portion of the Lower Patapsco aquifer;
- Sand layer in the upper portion of the Arundel Clay;
- Upper portion of the Patuxent aquifer

At each sample interval, a 5-foot long screen point and K-packer assembly were placed down the temporary 6-inch casing and then exposed to the aquifer materials by retracting the temporary casing. Water was then continuously purged from the sampler using a Grundfos Redi-Flo 2 sampling pump to ensure that representative groundwater, which had not been affected by the drilling activities, was moving into the screen point at the selected depth interval. During purging, field hydrogeochemical parameters, including temperature, pH, specific conductance, and turbidity, were monitored with a Horiba U-52 multiparameter water quality meter at regular (5-10 minute) intervals, and the measurements recorded in the field notebook. Once the field parameters stabilized and pH dropped to a level more indicative of natural groundwater conditions, groundwater samples were collected for field screening and laboratory analysis.

The groundwater samples were field screened for 1,1-dichloroethene (DCE) using compound-specific colorimetric tubes and submitted to a certified laboratory for VOC analysis using USEPA Test Method 8260B. An expedited (less than 24-hour) turn-around time was requested for the samples to allow for real-time evaluation of this and other site-related VOC concentrations within the water-bearing zones in the aquifer system. As mentioned above, the laboratory analytical results were reviewed to assess the vertical distribution of site-related VOCs and guide the construction of the monitoring well(s) at each location.

The highest site-related VOC concentrations were detected in the 71 to 76-foot (159.3µg/l) and 81 to 86-foot (239.5µg/l) samples from the MW-46D well borehole; as well as the 201 to 206-foot sample (119 µg/l) and the 211 to 216-foot sample (140.4 µg/l) from the MW-36D borehole. For these samples, 1,1-DCE was the only site-related VOC that exceeded the Maryland Groundwater Quality Standards. The samples from the MW-46D location were collected from the upper 15-20 feet of the confined portion of the Lower Patapsco Aquifer. The deeper samples from MW-46D well borehole - 101 to 106 feet and 111 to 116 feet - contained much lower concentrations of site related VOCs (6.1 µg/l and 4.1 µg/l respectively). For the MW-36D location, the samples with the slightly elevated VOC detections were from the sand deposits comprising the lower-most portion of the Lower Patapsco aquifer. The sample from 231 to 236 feet contained site-related VOCs of just 7 µg/l. The groundwater samples collected from the deeper Patuxent aquifer at the MW-36D location did not have laboratory detections of site-related VOCs.

The monitoring wells within the MW-30 pair also had very low detections of site-related VOCs, ranging from 1.1 to 6.3 µg/l, in the samples from the lower portion of the Lower Patapsco Aquifer and the Arundel Clay sand layer. No VOCs were present in these samples at concentrations above the Maryland Groundwater Quality Standards. In addition, there were no detections in the groundwater samples from the Patuxent Aquifer.

5 SAMPLING PLAN AND FIELD PROCEDURES

5.1 SAMPLING PLAN

In the first quarter of 2018, the groundwater monitoring event involved the sampling of the nine offsite monitoring wells installed in 2014, as this round of samples was collected prior to the 2018 well installation activities. Sampling protocols outlined in the September 2015 Offsite Groundwater Monitoring Plan (Monitoring Plan) were followed for this event. The remaining 2018 sampling events in the offsite area south of Maryland Route 100 were conducted in accordance with the 2015 Monitoring Plan following installation of the additional monitoring wells. This plan constituted the baseline sampling of the new wells comprising the offsite monitoring well network together with the continued, but less frequent, monitoring of the previously installed (2014) wells. The following is a description of the sampling plan for these offsite wells.

For new monitoring wells MW-29D, MW-30D pair, MW-32D, MW-34D, and MW-36D, groundwater samples were collected on a quarterly basis to characterize the hydrogeochemical conditions at these locations in either the Lower Patapsco and Patuxent aquifers, and evaluate the presence of seasonal fluctuations in VOC concentrations. The first baseline sampling event took place in the second quarter of calendar year 2018; therefore, the last quarter of baseline sampling will take place in the first quarter of 2019. The remaining offsite monitoring wells - MW-25D pair, MW-28D, MW-31D, MW-33D pair, and MW-35 - transitioned to being sampled on a semi-annual basis for the baseline (2018) year. Based on an agreement with MDE, the shallow wells in the unconfined portion of the Lower Patapsco aquifer, MW-25 and MW-28 were removed from the sampling program following the second quarter of 2018.

The sampling of existing wells MW-24D and MW-45 on the Williams-Scotsman property, along with new well MW-46D on the Verizon property, was consistent with the monitoring plan for the onsite wells. Based on this monitoring program, groundwater samples were collected semi-annually from these wells.

5.2 WATER LEVEL MEASUREMENTS

Field measurements of the depth to standing water in offsite monitoring wells were obtained during each sampling event using an electronic water level indicator. Static water level and total well depth measurements were taken at each monitoring well to determine fluctuations in the hydraulic head within the portion of the aquifer system screened by the well and identify potential siltation problems inside the well casing. All field measurements were recorded in a bound field notebook. Historic and 2018 water level measurements for the offsite monitoring wells are included in Table 2.

5.3 HYDRASLEEVE SAMPLING

The HydraSleeve™ sampling method was used to collect groundwater samples from the offsite monitoring wells in 2018. The HydraSleeve™ is a passive sampling technology capable of collecting representative groundwater samples for analysis of chlorinated VOCs and 1,4-dioxane. The depth intervals for deployment of the HydraSleeve™ samplers in the offsite wells are provided in Table 3.

The 2.5-foot long HydraSleeve™ sampler was attached to a weighted, nylon suspension tether and set at the pre-determined depth within the screened interval. The suspension line was then secured at the well head to ensure the sampler remains at

the designated depth during the stabilization period. Following a minimum 2-week equilibration period, the groundwater sample was collected by continuously pulling upward on the HydraSleeve™ until full. The HydraSleeve™ was removed from the well, and the sample immediately collected in the appropriate containers to minimize the diffusive loss of VOCs through the polyethylene wall of the sampler. After obtaining the requisite sample volume for chemical analysis, a representative aliquot of the remaining water is placed into the sample cup of a multi-parameter field meter for measurement of the following hydrogeochemical parameters:

- Temperature
- pH
- Specific conductivity
- Turbidity

The field parameter measurements for each sample are then documented in a field notebook. Table 4 summarizes the field parameter measurements for the offsite monitoring wells during the 2018 sampling events. The specific conductivity and turbidity could not be accurately measured during the February event due to malfunctioning of the field meter.

Following sample collection, a new HydraSleeve™ sampler was deployed in each well for the next sampling event.

5.4 ANALYTICAL METHODS

All groundwater samples were analyzed by a certified laboratory for VOCs using U.S. EPA SW-846 Test Method 8260B. In addition, the samples were analyzed for 1,4-dioxane using modified U.S. EPA Method 8260B with selective ion monitoring (SIM). These test methods were also used for field quality control (QC) samples – i.e., trip blanks, duplicate samples etc.

6 2018 GROUNDWATER MONITORING RESULTS

6.1 GROUNDWATER QUALITY STANDARDS FOR SITE-RELATED VOCS

The analytical results for all offsite monitoring wells are summarized in Table 5, and the 2018 analytical results are shown on Figure 4. Certified laboratory reports for each sampling event are included in Appendix A.

The cleanup criteria for all site-related constituents of concern (COCs), excluding 1,4-dioxane, detected in the offsite area are equivalent to the promulgated MDE groundwater quality standards listed below.

- 1,1,1-Trichloroethane (TCA) – 200 micrograms per liter (µg/l)
- 1,1-DCE – 7 µg/l
- 1,2-Dichloroethane (DCA) – 5 µg/l
- 1,1-DCA – 90 µg/l
- cis-1,2-DCE – 70 µg/l
- Trichloroethene (TCE) – 5 µg/l

These values correspond to the standards for Type I and II aquifers, and maximum contaminant levels (MCLs) and secondary MCLs developed by the U.S. Environmental Protection Agency (EPA) under the Safe Drinking Water Act. Based on the site hydrogeologic and hydrogeochemical data, the Lower Patapsco aquifer and Patuxent aquifer meet the definition of a Type I aquifer provided in the MDE document *Cleanup Standards for Soil and Groundwater, Interim Final Guidance* (Update No. 2.1).

At present, no groundwater quality standard has been promulgated by MDE or U.S. EPA for 1,4-dioxane. Using the current default exposure factors developed by U.S. EPA and a target cancer risk of 1E-5, MDE has used a calculated risk-based groundwater criterion for 1,4-dioxane of 4.6 µg/l with respect to the plume emanating from the former Kop-Flex facility property. Based on the known use of private wells as a potable water source in the residential areas containing the monitoring well network, this risk-based level has been adopted to evaluate the extent of impacted groundwater for the offsite area.

The following section discuss the analytical results for each quarterly sampling event, with the primary focus on the site-related COCs listed above.

6.2 RESULTS OF QUARTERLY SAMPLING EVENTS

6.2.1 1ST QUARTER 2018

First quarter groundwater samples were collected from the nine offsite monitoring wells (MW-25, MW-25D-130, MW-25D-192, MW-28, MW-28D, MW-31D, MW-33D-235, MW-33D-295, MW-35D) installed in 2014, on February 13-14, 2018. Laboratory analytical data packages are included as Appendix A, and the sample results are summarized in Table 5.

No site-related COCs were detected in the groundwater samples collected from shallow wells MW-25 and MW-28 screened in the unconfined portion of the Lower Patapsco aquifer. Concentrations of the primary site-related VOCs in the confined Lower Patapsco aquifer south of Maryland Route 100 are provided in Figure 4. Overall, the concentrations of the site-related VOCs and 1,4-dioxane in the February 2018 groundwater samples from wells screened in the confined portion of the Lower Patapsco aquifer were similar to the levels detected in the samples collected during previous sampling events in 2017. For the two deep wells at the MW-25/MW-25D location, the total concentration of site-related VOCs and 1,4-dioxane in the MW-25D-130 sample (234.8 µg/l), is higher than the total concentration detected in the deeper well at this location (MW-25D-192; 136.6 µg/l). The concentrations of 1,1-DCE and 1,4-dioxane in the samples from both wells exceeded their respective Groundwater Quality Standard and risk-based comparative criterion, respectively. The lower VOC concentrations in the sample from MW-25D-192 are consistent with the vertical distribution of constituents in onsite and offsite areas north of Maryland Route 100. The presence of slightly elevated VOC levels in the MW-25D-192 sample indicate downward transport and/or dispersion of site-related constituents within the thick sandy deposits in this portion of the aquifer immediately south of the site. The sampling data for the deep monitoring wells located further downgradient (MW-28D, MW-31D, MW-35D, and the paired MW-33D wells) indicate non-detect to very low concentrations of site-related VOCs and 1,4-dioxane. The only site-related constituent exceeding the Groundwater Quality Standards was 1,4-dioxane in the MW-33D-295 sample (6.9 µg/L).

6.2.2 2ND QUARTER 2018

Groundwater samples were collected from all offsite monitoring wells during the second quarter of 2018 on May 30–31st. This sampling event represents the first round of baseline monitoring for the newly installed monitoring wells. Laboratory analytical data packages are included as Appendix A, and the sample results are summarized in Table 5.

No site-related COCs were detected in the samples from the shallow (unconfined) Lower Patapsco aquifer wells in the residential areas (MW-25 and MW-28), and on the Williams-Scotsman facility to the east of the former Kop-Flex property (MW-45).

Based on evaluation of the water level data (Table 2 and Figure 5), new confined zone well MW-46D on the neighboring Verizon maintenance facility is situated hydraulically upgradient of the former Kop-Flex facility. Even with this location with respect to the inferred flow paths in the Lower Patapsco aquifer, the initial groundwater sample from this well contained concentrations of 1,1-DCE (29.4 µg/l) and 1,4-dioxane (73.5 µg/l) above their respective standards.

Concentrations of the site-related VOCs and 1,4-dioxane in the groundwater samples from the deeper, confined wells located downgradient of the former Kop-Flex facility are similar to the levels detected in samples collected during previous monitoring events and the corresponding distribution of the contaminant plume. The sample from well MW-24D, on the neighboring William-Scotsman property to the south, contained the highest concentrations of both 1,1-DCE (529 µg/l) and 1,4-dioxane (187 µg/l) (Figure 4). The concentrations in the confined portion of the Lower Patapsco aquifer decrease as groundwater flows to the south of Route 100. At the MW-25/25D location, the total concentrations of site-related VOCs and 1,4-dioxane ranged from 208.2 µg/l in the MW-25D-130 sample to 127.1 µg/l in the sample from the deeper well at the same location (MW-25D-192). As mentioned above, the lower VOC concentrations in the sample from MW-25D-192 are consistent with the vertical distribution of contaminants in deep wells on and a short distance downgradient of the former Kop-Flex facility, with 1,1-DCE and 1,4-dioxane concentrations exceeding their respective Groundwater Quality Standard and risk-based comparative criterion, respectively in both samples (Figure 4). In addition, the sampling data for the confined Lower Patapsco monitoring wells located further downgradient indicate non-detect to low concentrations of site-related VOCs and 1,4-dioxane. Samples collected from two of the seven wells contained concentrations of 1,1-DCE and/or 1,4-dioxane exceeding the applicable criteria. Specifically, these included the sample from well MW-30D-273, which contained 27.4 µg/l of 1,1-DCE and 16.4 µg/l of 1,4-dioxane, and well MW-33D-295 with 6.9 µg/l of 1,4-dioxane (Figure 4).

Groundwater samples collected from the new wells screened in the deeper Patuxent aquifer (MW-30D-413 and MW-36D) had no detections of site-related VOCs. Tetrachloroethene (PCE) was detected at a concentration of 2.3 µg/l in the sample from well MW-36D, which is below the Groundwater Quality Standard of 5 µg/l. Based on the historical offsite monitoring data, the presence of this chlorinated compound is associated with some unknown source and is unrelated to the Former Kop-Flex Facility Site.

6.2.3 3RD QUARTER 2018

Third quarter groundwater samples were collected from monitoring wells MW-29D, MW-30D-273, MW-30D-413, MW-32D, MW-34D, and MW-36D on August 23, 2018; representing the second event as part of the baseline monitoring for the new wells installed in the offsite residential areas. Laboratory analytical data packages are included in Appendix A, and the sample data are presented in Table 5.

The analytical results for the August 2018 samples are generally similar to the data from the previous (May 2018) monitoring event. For the wells screened in the confined Lower Patapsco aquifer, site-related COCs were only detected in the groundwater sample collected from MW-30D-273 (Figure 4). The total COC concentration in this sample (67.9 µg/l) was slightly higher than the level from the May 2018 sampling event (43.8 µg/l), with concentrations of 1,1-DCE (27.4 µg/l) and 1,4-dioxane (16.4 µg/l) above the applicable criteria.

Groundwater samples collected from the new Patuxent aquifer wells – MW-30D-413 and MW-36D – had no detections of COCs associated with the Former Kop-Flex Site. PCE, which was detected in the May 2018 sample from well MW-36D, was not present above the reporting limit in the sample collected during this event.

6.2.4 4TH QUARTER 2018

Fourth quarter groundwater samples were collected from all offsite monitoring wells screened in the confined Lower Patapsco aquifer and Patuxent aquifer on November 8, 2018. Laboratory analytical data packages are included in Appendix A, and the data are summarized in Table 5. Figure 4 includes results for the site-related compounds.

As with the May 2018 sample, well MW-46D on the adjacent Verizon property contained low to very low levels of several site-related VOCs and 1,4-dioxane. Both 1,1-DCE (99.6 µg/l) and 1,4-dioxane (96.7 µg/l) were detected at slightly higher concentrations than the May 2018 sample, with both levels above their respective numerical comparative criteria.

Well MW-24D on the neighboring William-Scotsman property to the south contained 560 µg/l of 1,1-DCE. However, contrary to previous sampling events, no 1,4-dioxane was detected above the reporting limit in this sample. This result is not consistent with the historical sampling data for this well, where 1,4-dioxane has typically been present with detected concentrations greater than 150 µg/l. WSP will continue to monitor the VOC concentrations detected in this well during the 2019 sampling events.

For the deep wells at the MW-25/MW-25D location, the total concentration of site-related VOCs and 1,4-dioxane in the MW-25D-130 sample (154.7 µg/l) continues to be higher than the concentrations in the deeper well at this location (MW-25D-192; 133.8 µg/l). However, the total VOC concentration in the MW-25D-130 sample (114.5 µg/l) were lower than previous events because of a reduction in the 1,1-DCE concentration (Figure 4). The sampling data for the confined Lower Patapsco aquifer monitoring wells located further downgradient typically contained non-detect to very low concentrations of site-related VOCs and 1,4-dioxane (Figure 4). The exception was the sample from well MW-30-273, which contained 44.0 µg/l of 1,1-DCE and 22.2 µg/l of 1,4-dioxane. These concentrations were similar to the levels detected in the August 2018 sample from this well. Additionally, the sample from MW-33D-295 contained a concentration of 1,4-dioxane (6.1 µg/l)

above the applicable risk-based criterion. It should also be noted the sample from MW-28D contained a concentration of 6.9 µg/l of 1,1-DCE, which is just below the applicable Groundwater Quality Standard of 7 µg/l.

No VOCs were detected in the samples from the deeper wells screened in the Patuxent Aquifer at the MW-30 location (MW-30-413) and MW-36D (Figure 4). These results are consistent with the previous (August 2018) sampling event.

7 SUMMARY AND CONCLUSIONS

7.1 COC DISTRIBUTION

The overall direction of groundwater flow, and associated migration of dissolved VOCs, in the confined Lower Patapsco aquifer is to the south/southeast from the site. A potentiometric surface contour map showing the direction of groundwater flow within this hydrostratigraphic unit based on water level data from the November 2018 sampling event can be found in Figure 5. The potentiometric surface elevations on the figure are labeled in feet above mean sea level (MSL).

The two, primary site-related COCs in the offsite groundwater are 1,1 DCE and 1,4-dioxane. Based on historical analytical data, the presence of 1,1-DCE and 1,4-dioxane (and other site-related constituents) is limited to the deeper (confined) Lower Patapsco aquifer. The concentrations of the site-related VOCs and 1,4-dioxane were generally consistent across the different rounds of sampling performed to 2018 from wells screened in this portion of the aquifer system. The only exception being the non-detection of 1,4-dioxane in the November 2018 sample from MW-24D. Iso-concentration maps shown in Figures 6 and 7 depict the inferred horizontal extent of the 1,1 DCE and 1,4-dioxane plumes within the confined portion of the Lower Patapsco aquifer. These iso-concentration maps were created using data from the May 2018 site-wide sampling event, and include data for the onsite monitoring wells to get a better sense of the VOC distribution within the aquifer. The offsite wells containing the highest site-related VOC concentrations - MW-24D on the William Scotsman property and MW-25D-130 in the Harmans Woods residential community - are located less than ¼ mile south (hydraulically downgradient) of the former Kop-Flex facility. Other offsite monitoring wells south of Maryland Route 100 that have repeatedly contained 1,1 DCE and 1,4-dioxane above the applicable comparative criteria in recent (2018) samples are MW-30D-273 and MW-33D-295. The sample results for new wells MW-29D, MW-32D and MW-34D, together with data from the previously installed wells, delineate the width and downgradient extent of the plume in the confined Lower Patapsco aquifer.

In general, the vertical distribution of site-related chemicals in the Lower Patapsco aquifer is represented by the concentrations of 1,1-DCE (Figure 8) and 1,4-dioxane (Figure 9) in cross sectional view over the area of interest. The iso-concentration contours depicting the contaminant plumes incorporates groundwater quality data from the sampling of residential wells to help assess the COC distribution within the aquifer system. Based on evaluation of the sampling data, the deep semi-confined sand zone in the Lower Patapsco Aquifer represents the primary hydrostratigraphic interval for the migration of the COCs in the aquifer system. The regional southeast dip of the lithological units comprising the hydrogeologic framework results in a corresponding decrease in the depth of the plumes in the downgradient direction from the former Kop-Flex facility. The detection of very low COC concentrations in depth-discrete samples from the MW-30D and MW-36D boreholes and deep (300 to 350-foot) residential wells in the Twin Oaks Road and Andorick Acres areas indicates limited downward migration of constituents into the sand layer occurring in the upper portion of the Arundel Clay hydrogeologic unit. However, as indicated by the non-detect levels in samples from the Patuxent aquifer, site-related constituents have not seeped through the thick clayey deposits that comprise the confining aquitard within the hydrostratigraphic sequence. Additionally, the potential migration of COCs to the indoor air via soil vapor intrusion is believed to be non-existent for any of the properties within the offsite plume area due to the following site characteristics:

- significant (>100-foot) depth of the COC contamination in groundwater;
- presence of low permeability (clayey) deposits in the shallow subsurface over areas where the depth to the deep groundwater plume is lowest; and
- generally consistent non-detect COC levels in groundwater samples from shallow wells MW-25 and MW-28

Data from monitoring wells screened below the Arundel Clay in the Patuxent aquifer, MW-30D-413 and MW-36D, show no site-related VOCs. These sampling results suggest dissolved VOCs comprising the plume in the Lower Patapsco aquifer

have not migrated through the Arundel Clay to the underlying Patuxent aquifer. As discussed in Section 6.2.2, PCE was detected in the initial sample from well MW-36D at 2.3 µg/l. Historically, PCE has only been detected at a concentration of 1.1 µg/l in a 2014 sample from well MW-25D-130 in the Harmans Wood community to the north of MW-36D. The consistent lack of detectable PCE in the offsite monitoring data suggests the isolated detection of this compound is unrelated to the groundwater plume in the confined Lower Patapsco aquifer that extends into the residential areas south of Route 100.

7.2 COC CONCENTRATION TRENDS

Figures 10 through 14 include graphs that show concentrations of 1,1-DCE and 1,4-dioxane with respect to time for wells MW-24D, MW-25D-130, MW-25D-192, MW-28D, and MW-33D-295. Additional sampling data is needed from wells MW-30D-273 and MW-46D to examine the VOC concentrations over time at these offsite monitoring locations.

The data presented in the concentration vs. time plots are for groundwater samples collected using different field methods. The low-flow sampling procedure was utilized to collect monitoring well samples through the 3rd quarter of 2016. Given the applicability of the HydraSleeve™ sampler determined from the spring/summer 2016 field demonstration study, the use of this passive sampling device was adopted in place of the low-flow method. The conversion from the low-flow to passive (HydraSleeve™) method was implemented during the 4th quarter 2016 monitoring event. Since constancy in sampling-related variables is important when evaluating temporal changes in COC concentrations, the qualitative assessment of trends in 1,1-DCE and 1,4-dioxane levels in wells samples only considers data for samples obtained using the HydraSleeve™ sampler.

As shown in the data plots, COC concentrations have exhibited stable trends in some wells (e.g., MW-25D-192 [Figure 12] and MW-33D-295 [Figure 14]), while other wells, such as MW-24D (Figure 10) and MW-25D-130 (Figure 11) show a decrease in concentrations of 1,1 DCE and 1,4-dioxane since startup of the onsite groundwater remediation system through 2017 and 2018. Wells MW-24D and MW-25D-130 are the closest downgradient monitoring points to the deep groundwater recovery wells and are screened in the same portion of the aquifer system as the pumping wells. Thus, the apparent concentration trends indicated by samples from these monitoring wells are believed to be related to the extraction of COC-containing groundwater by the onsite hydraulic containment system. The temporal change in COC levels suggests the hydraulic containment system is successfully removing site-related dissolved VOCs from the confined portion of the Lower Patapsco aquifer and limiting further offsite migration.

The stability of COC concentrations in the samples from wells MW-28D (Figure 13) and MW-33D-295 (Figure 14), which are both situated near the limits of the affected groundwater area, indicates the plume has likely reached a stable, or steady-state, condition. The temporal change in 1,1-DCE levels suggests the hydraulic containment system is successfully treating site-related dissolved VOCs and limiting further offsite migration.

7.3 PLANNED 2019 OFFSITE GROUNDWATER MONITORING ACTIVITIES

During 2019, WSP will continue to collect water level data and groundwater samples using the passive, HydraSleeve™ sampling device from the 16 off-property monitoring wells completed in the confined Lower Patapsco and Patuxent aquifers. The process of collecting water level readings and groundwater quality samples will be consistent with the procedures described in Sections 5.2 and 5.3 of this report. The management of IDM will follow the procedures described in Section 5.4.

The offsite groundwater sampling activities will be conducted during the 1st, 2nd, and 4th quarters of 2019. During the 1st quarter, water level measurements will be collected from each offsite monitoring well and groundwater samples will be collected from 6 offsite wells installed in 2018 (MW-29D, MW-30D-273, MW-30D-413, MW-32D, MW-34D, and MW-36D). This sampling event will comprise the final quarterly, baseline monitoring round required for the wells installed in 2018. Upon completion of this event, these wells will move to a semi-annual sampling schedule to coincide with the other offsite monitoring wells. The second and fourth quarter sampling will constitute the semi-annual groundwater monitoring events of 2019. For these sampling events, water levels will be measured at all offsite monitoring wells, including the shallow wells in the unconfined portion of the Lower Patapsco aquifer and groundwater samples will be collected from all deep (confined) offsite wells. No groundwater samples will be collected during the 3rd quarter of 2019. However, WSP will collect water level measurements from all offsite monitoring wells to gather additional data on the hydraulic heads within the Lower Patapsco and Patuxent Aquifers.

The existing well network is sufficient to monitor the distribution of site-related COCs in the Lower Patapsco aquifer and potential migration of constituents downward to the underlying Patuxent aquifer. Historical analytical results from the shallow offsite wells (MW-25 and MW-28) indicate site-related COCs are not present in the unconfined portion of the Lower Patapsco aquifer south of Maryland Route 100. As these wells are no longer part of the offsite monitoring program, WSP recommends they be abandoned by a Maryland licensed driller under WSP's supervision.

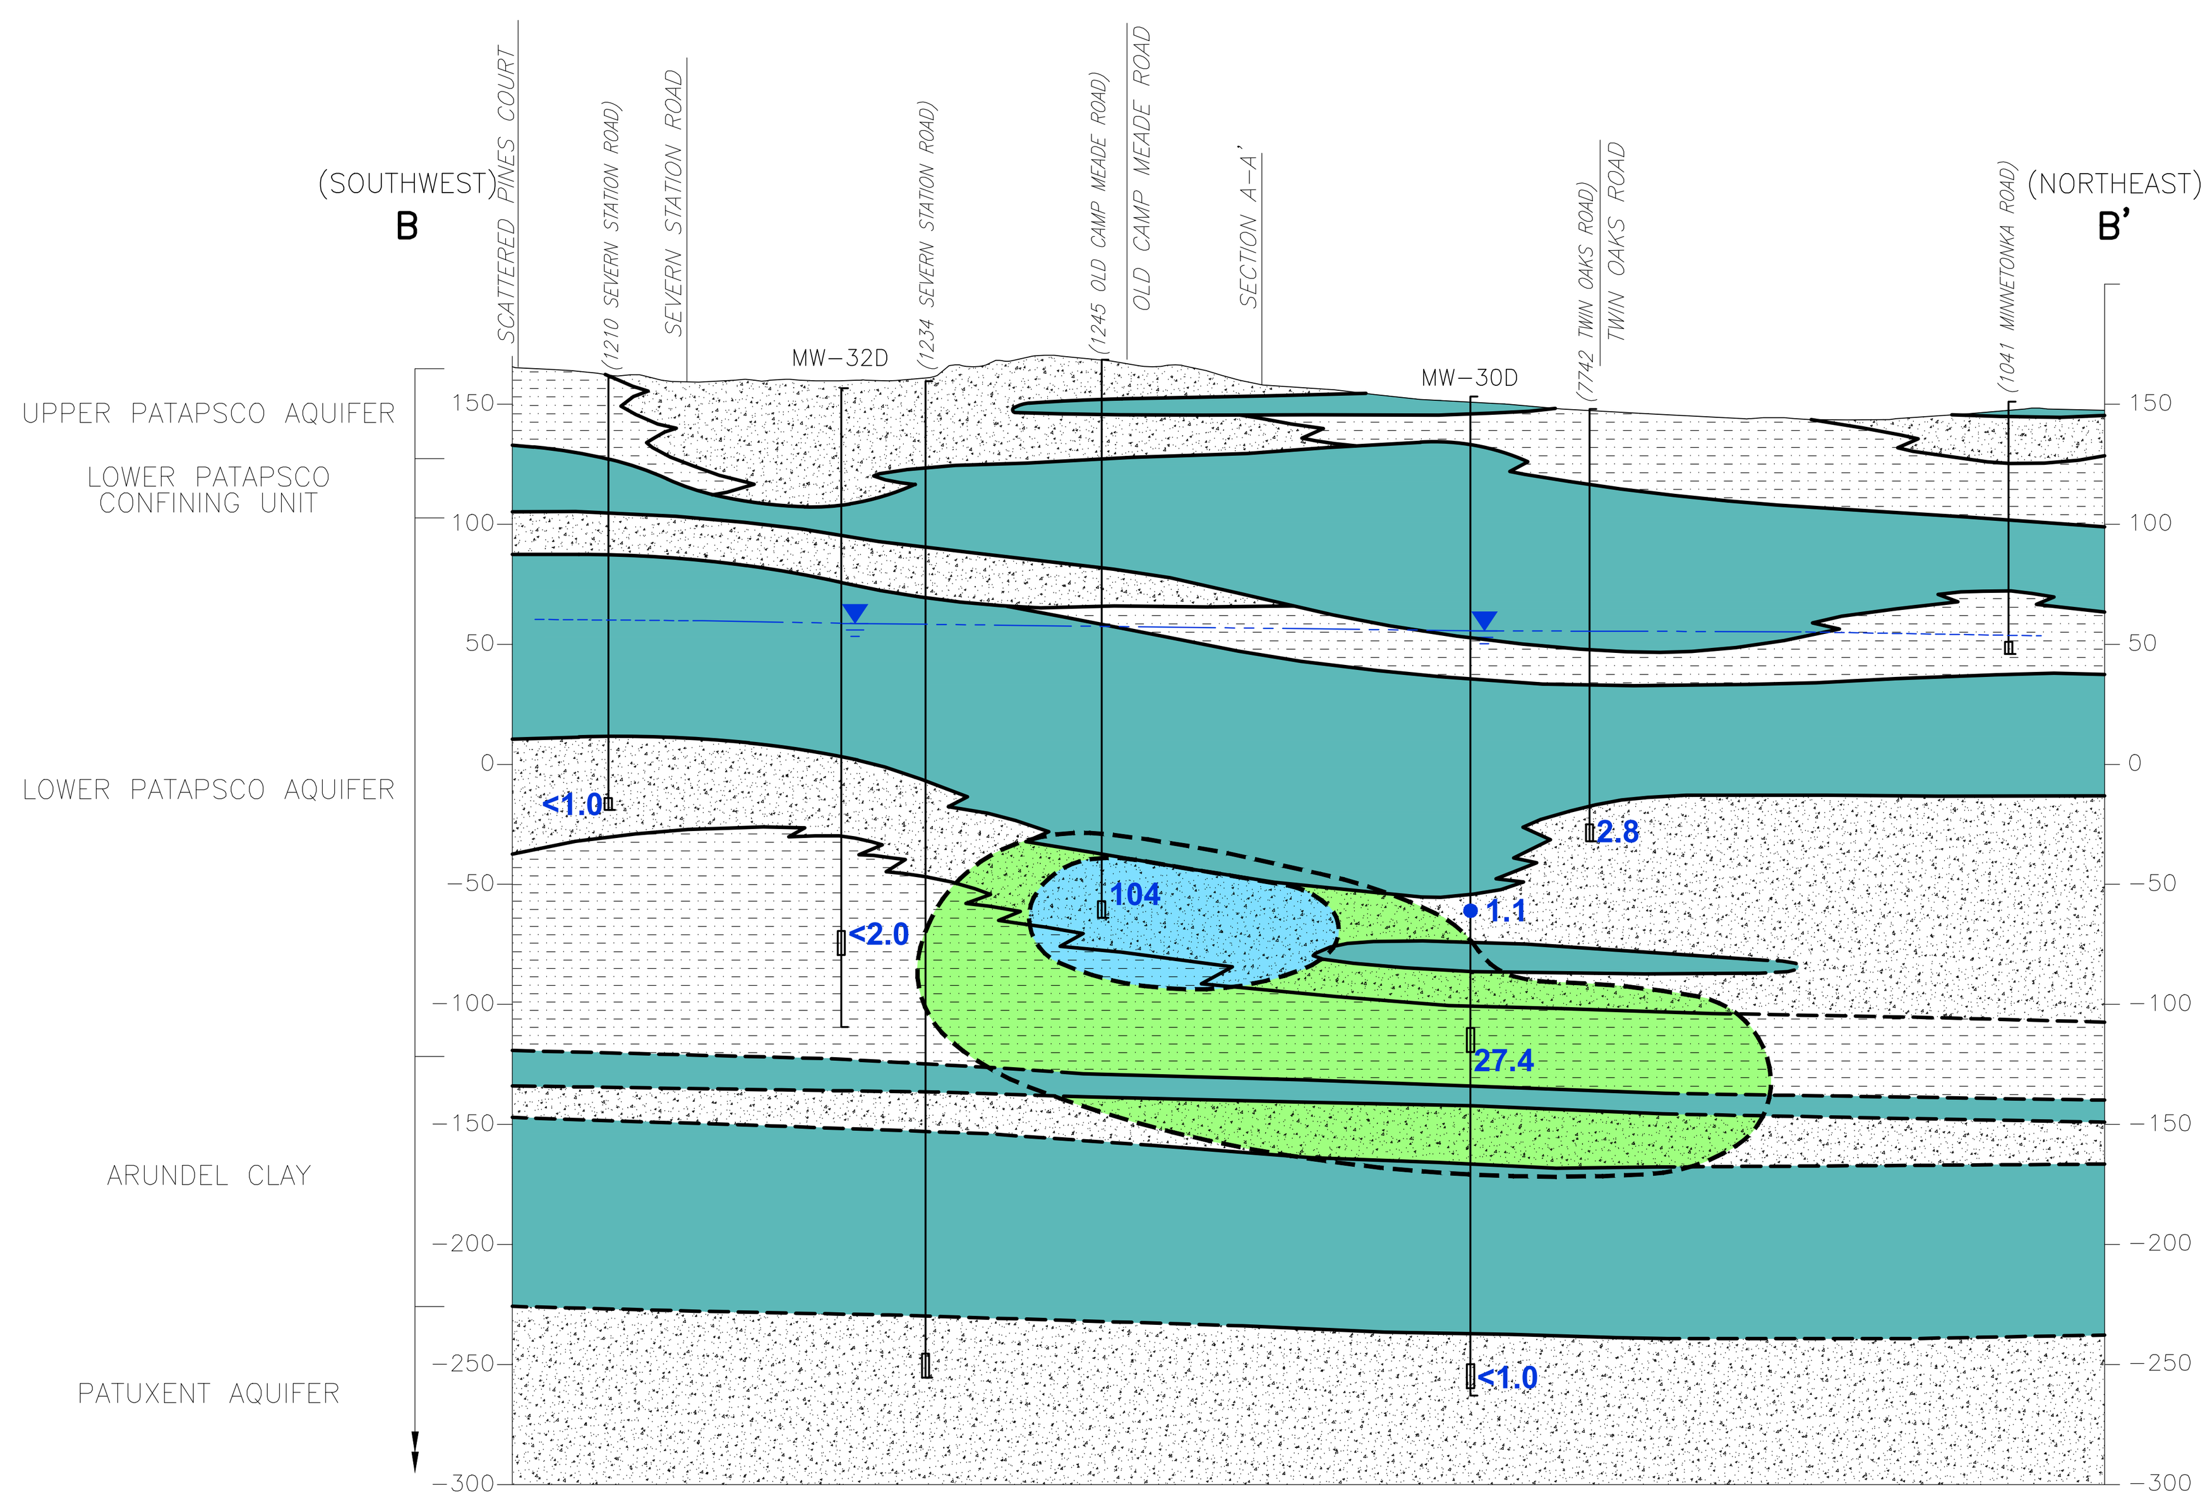
2018 KOP-FLEX INFERRED 1,4-DIOXANE DISTRIBUTION IN CONFINED ZONE OF LOWER PATAPSCO AQUIFER

FORMER KOP-FLEX FACILITY
HANOVER, MARYLAND

PREPARED FOR
EMERSON
ST. LOUIS, MISSOURI

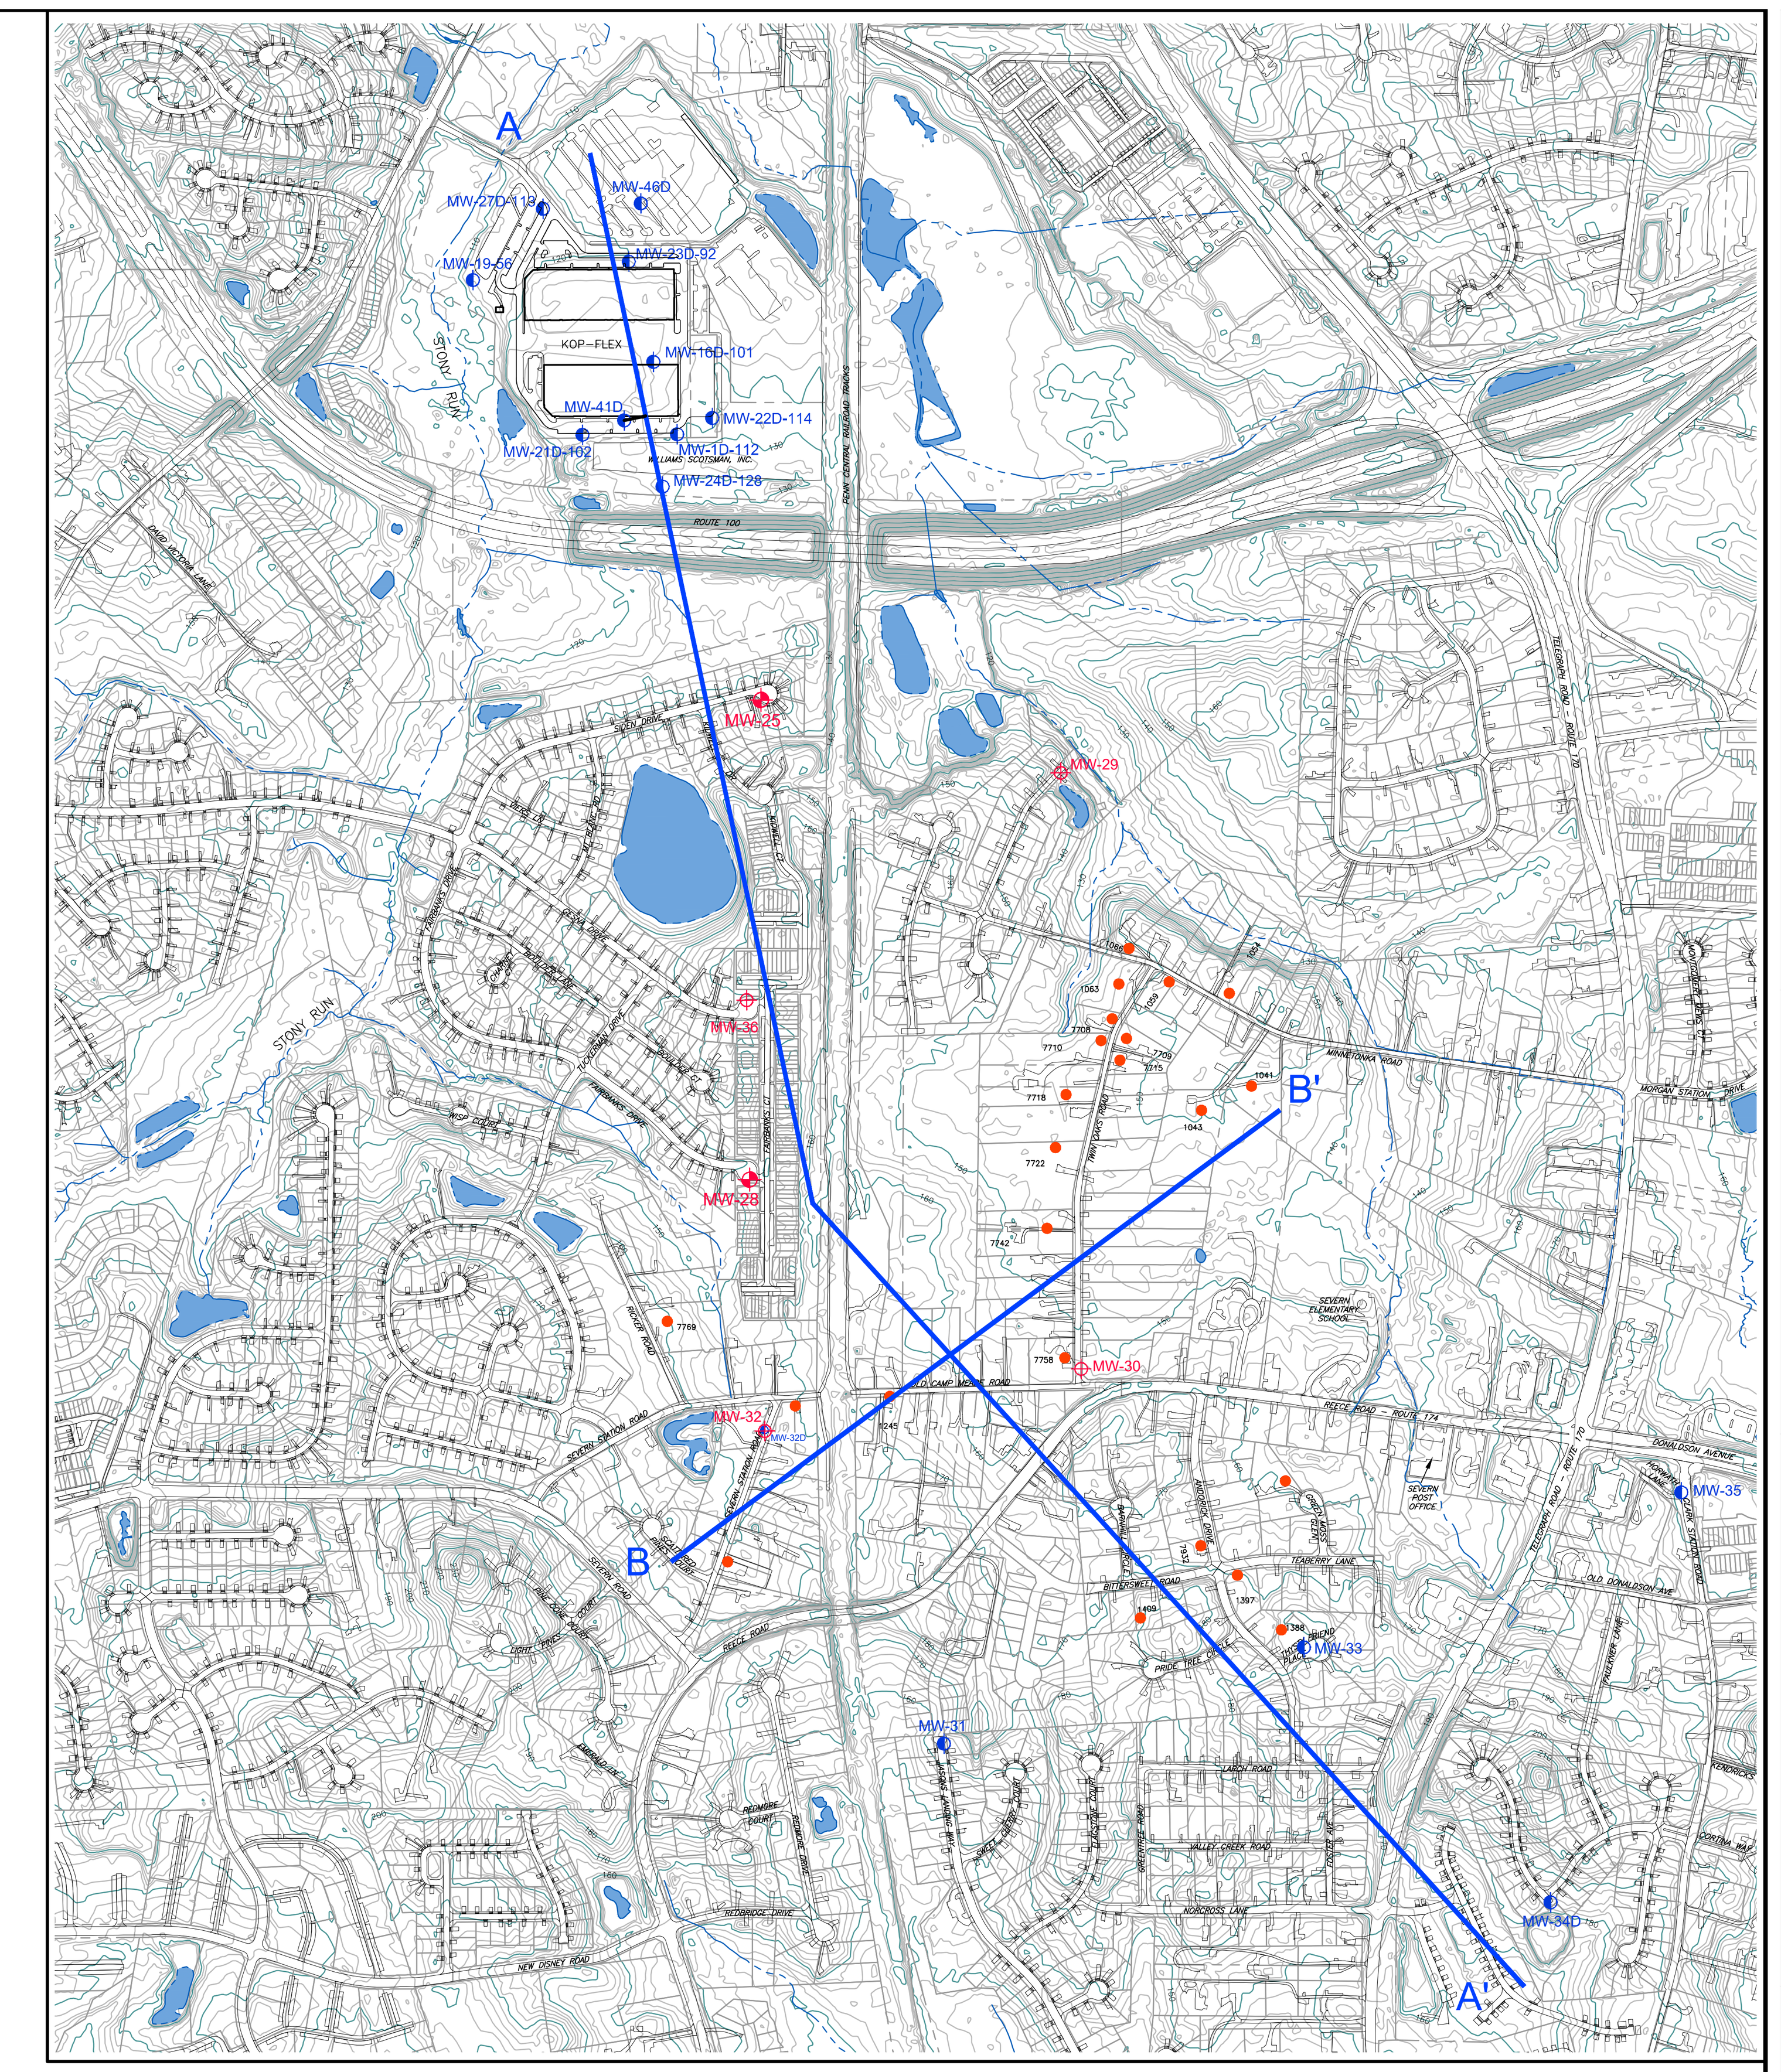
Drawn By: EGC 8/8/2018
Checked: MML
Approved: RKJ
DWG Name: 314V1545.011-010



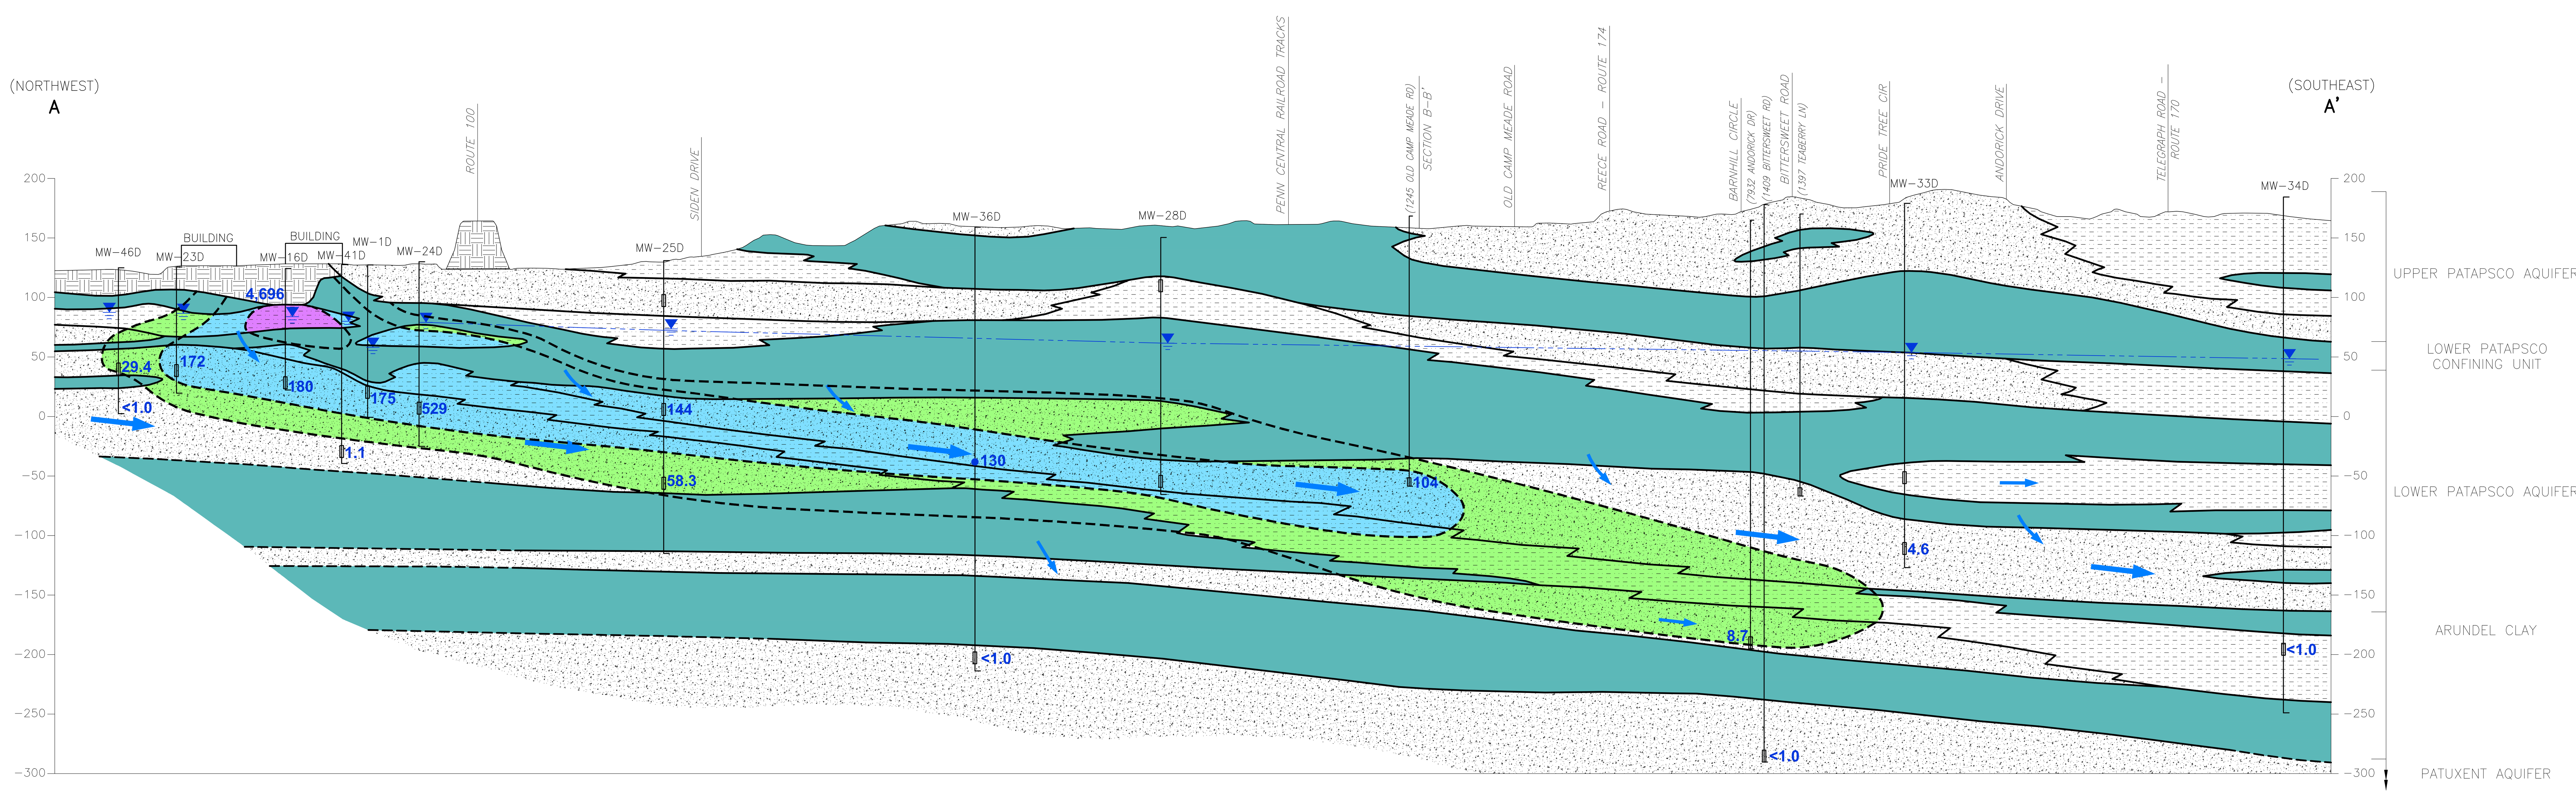
LEGEND

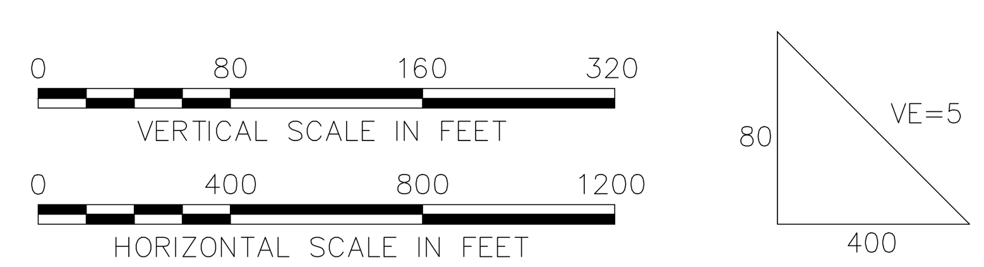
- SAND
- INTERLAYERED SAND AND CLAY
- CLAY
- FILL MATERIAL
- BOREHOLE
- POTENTIOMETRIC HEAD IN LOWER PATAPSCO AQUIFER
- 120 — 1,1-DICHLOROETHENE CONCENTRATION (ug/l)
- SCREEN
- END OF BOREHOLE
- POTENTIOMETRIC SURFACE, CONFINED PORTION OF LOWER PATAPSCO AQUIFER
- GROUNDWATER FLOW PATH IN CONFINED PORTION OF LOWER PATAPSCO AQUIFER
- 1,1-DCE CONCENTRATION CONTOUR
- >7 ug/l
- >100 ug/l
- >1000 ug/l

NOTE:
EXISTING GRADE IS BASED ON SURFACE ELEVATION AT THE SECTION LINE NOT THE ELEVATION OF THE TOP OF THE MONITORING WELL OR BOREHOLE.



CROSS SECTION LOCATION MAP
SCALE: 1"=800'





THE ORIGINAL VERSION OF THIS DRAWING IS IN COLOR. BLACK AND WHITE COPIES MAY NOT ACCURATELY DEPICT CERTAIN INFORMATION.

a/ All sample concentrations are in micrograms per liter (µg/l).
DCA = dichloroethane; DCE = dichloroethene; TCA = trichloroethane; TCE = trichlorothene
U = not detected above the method detection limit; J = estimated concentration between the reporting limit and method detection limit.
Bolded values indicate an exceedence of the Groundwater Quality Standards

RE: Project: KOPFLEX 3140038912
Pace Project No.: 92373521

Dear Eric Johnson:
Enclosed are the analytical results for sample(s) received by the laboratory on February 15, 2018. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Taylor Ezell

QUALIFIERS

Project: KOPFLEX 3140038912
Pace Project No.: 92373521

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-C	Pace Analytical Services - Charlotte

ANALYTE QUALIFIERS

C9	Common Laboratory Contaminant.
L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

RE: Project: Kop FLex
Pace Project No.: 92386848

Dear Eric Johnson:
Enclosed are the analytical results for sample(s) received by the laboratory on June 01, 2018. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Taylor Ezell

Huntersville, NC 28078
(704)875-9092

QUALIFIERS

Project: Kop FLex
Pace Project No.: 92386848

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-C	Pace Analytical Services - Charlotte

ANALYTE QUALIFIERS

L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.
M0	Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

RE: Project: Kopflex
Pace Project No.: 92397044

Dear Eric Johnson:
Enclosed are the analytical results for sample(s) received by the laboratory on August 24, 2018. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Taylor Ezell

QUALIFIERS

Project: Kopflex
Pace Project No.: 92397044

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-C	Pace Analytical Services - Charlotte

ANALYTE QUALIFIERS

M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

RE: Project: KOPFLEX OFFSITE
Pace Project No.: 92406866

Dear Eric Johnson:
Enclosed are the analytical results for sample(s) received by the laboratory on November 12, 2018. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Taylor Ezell

Huntersville, NC 28078
(704)875-9092

QUALIFIERS

Project: KOPFLEX OFFSITE
Pace Project No.: 92406866

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-C	Pace Analytical Services - Charlotte

ANALYTE QUALIFIERS

C9	Common Laboratory Contaminant.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
R1	RPD value was outside control limits.
S3	Surrogate recovery exceeded laboratory control limits. Analyte presence below reporting limits in associated sample.

Pace Analytical	Document Name: **Sample Condition Upon Receipt(SCUR)**	Document Revised: February 7, 2018 Page 1 of 2
	Document No.: **F-CAR-CS-033-Rev.06**	Issuing Authority: Pace Carolinas Quality Office

Laboratory receiving samples:
Asheville ☐ Eden ☐ Greenwood ☐ Huntersville ☑ Raleigh ☐ Mechanicsville ☐

Sample Condition Upon Receipt

Client Name: WSP

Project **WO# : 92406866**

92406866

Courier: ☑ Fed Ex ☐ UPS ☐ USPS ☐ Client ☐ Commercial ☐ Pace ☐ Other:____

Custody Seal Present? ☑ Yes ☐ No **Seals Intact?** ☑ Yes ☐ No

Date/Initials Person Examining Contents: MH 11-12-18

Packing Material: ☐ Bubble Wrap ☑ Bubble Bags ☐ None ☐ Other

Biological Tissue Frozen? ☐ Yes ☐ No ☑ N/A

Thermometer: ☑ IR Gun ID: 92T045 **Type of Ice:** ☑ Wet ☐ Blue ☐ None

Cooler Temp (°C): 5.5 **Correction Factor:** Add/Subtract (°C) -0.1

Cooler Temp Corrected (°C): 5.4

Temp should be above freezing to 6°C
☐ Samples out of temp criteria. Samples on ice, cooling process has begun

USDA Regulated Soil (☑ N/A, water sample)
Did samples originate in a quarantine zone within the United States: CA, NY, or SC (check maps)? ☐ Yes ☐ No

Did samples originate from a foreign source (internationally, including Hawaii and Puerto Rico)? ☐ Yes ☐ No

				Comments/Discrepancy:
Chain of Custody Present?	☑ Yes	☐ No	☐ N/A	1.
Samples Arrived within Hold Time?	☑ Yes	☐ No	☐ N/A	2.
Short Hold Time Analysis (<72 hr.)?	☐ Yes	☑ No	☐ N/A	3.
Rush Turn Around Time Requested?	☐ Yes	☑ No	☐ N/A	4.
Sufficient Volume?	☑ Yes	☐ No	☐ N/A	5.
Correct Containers Used?	☑ Yes	☐ No	☐ N/A	6.
-Pace Containers Used?	☑ Yes	☐ No	☐ N/A	
Containers Intact?	☑ Yes	☐ No	☐ N/A	7.
Dissolved analysis: Samples Field Filtered?	☐ Yes	☐ No	☑ N/A	8.
Sample Labels Match COC?	☑ Yes	☐ No	☐ N/A	9.
-Includes Date/Time/ID/Analysis Matrix: WT				
Headspace in VOA Vials (>5-6mm)?	☐ Yes	☑ No	☐ N/A	10.
Trip Blank Present?	☑ Yes	☐ No	☐ N/A	11.
Trip Blank Custody Seals Present?	☑ Yes	☐ No	☐ N/A	

COMMENTS/SAMPLE DISCREPANCY **Field Data Required?** ☐ Yes ☐ No

received 5 vials for MW-30D-273

Lot ID of split containers:
